

1. Create a PHP project, containing :
SQL Database
.php files
index.html file

On "index.html" there must be a page with 2 input fields. One field saves "A" Table Values (all data types), and the second saves "B" table values (only numerical).
There must also be two buttons, one which when pressed displays the "A" table data, and one that when pressed displays "B" table data.

Requirements:

- Frameworks are not allowed. PHP version must be PHP 7.2 or higher.
- The Project must be working just by opening the index.html file(while running Apache and MySQL servers as well).
- No styling is necessary, but it's a bonus if you add some of your own liking.
- Author must be able to answer questions about functions and structure of the project.
